- Applications

Fuel Cell Modeling

Practical aspects

Examples of Components in a Technology Demonstrator

Deterministic Dynamic Programming – Parallel Hybrid Example

- Fuel-optimal torque split factor $u(SOC, t) = \frac{T_{e-motor}}{T_{gearbox}}$
- ECE cycle
- Constraints $SOC(t = t_f) \geq 0.6, SOC \in [0.5, 0.7]$

Global optimum guaranteed within discretization.

Non-causal.

Full knowledge about the mission.

Curse of dimensionality $N_t N^{2d}$.

$d \in [1, 3]$

The [reference tool](#) used for development and comparisons.

Heuristic Control Approaches

- Parallel hybrid vehicle (electric assist)

- Determine control output as function of some selected state variables:
vehicle speed, engine speed, state of charge, power demand, motor speed, temperature, vehicle acceleration, torque demand

On-Line Control – ECMS

- ▶ Given the optimal λ^* (cycle dependent exchange rate between fuel and electricity) .

- ▶ Hamiltonian

$$H(t, q(t), u(t), \lambda^*) = P_f(t, u(t)) + \lambda^* P_{ech}(t, u(t))$$

- ▶ Optimal control action

$$u^*(t) = \arg \min_u H(t, q(t), u, \lambda^*)$$

- ▶ Guess λ^* , run one cycle see end SOC, update λ^* , and iterate until $SOC(t_f) \approx SOC(0)$.

5/41

ECMS – Equivalent Consumption Minimization Strategy

- ▶ μ_0 depends on the (soft) constraint

$$\mu_0 = \frac{\partial}{\partial q(t_f)} \phi(q(t_f)) = \text{/special case/} = -w$$

- ▶ Different efficiencies

$$\mu_0 = \frac{\partial}{\partial q(t_f)} \phi(q(t_f)) = \begin{cases} -w_{dis}, & q(t_f) > q(0) \\ -w_{chg}, & q(t_f) < q(0) \end{cases}$$

- ▶ Introduce equivalence factor (scaling) by studying battery and fuel power

$$s(t) = -\mu(t) \frac{H_{LHV}}{V_b Q_{max}}$$

ECMS – Equivalent Consumption Minimization Strategy

Fuel Cell Modeling

Practical aspects

- Examples of Components in a Technology Demonstrator

7/41

Introducing xEVs - From Victor Judez @ CEVT, Lecture Day 1

8/41

Fuel Cell Basic Principles

- ▶ Convert fuel directly to electrical energy
- ▶ Let an ion pass from an anode to a cathode
- ▶ Take out electrical work from the electrons

9/41

Fuel Cell Stack

- ▶ The voltage out from one cell is just below 1 V.
- ▶ Fuel cells are stacked, in series.

10/41

Components in a Fuel Cell Stack

11/41

Overview of Different Fuel Cell Technologies

12/41

AFC – Alkaline Fuel cell

- ▶ Among the most efficient fuel cells 70%
- ▶ Low temperature 65-220°C
 - ▶ Quick start, fast dynamics
 - ▶ No co-generation
- ▶ Sensitive to poisoning

13 / 41

PEMFC – Proton Exchange Membrane Fuel Cell

Advantages:

- ▶ Relatively high power-density characteristic
- ▶ Operating temperature, less than 100°C
 - Allows rapid start-up
- ▶ Good transient response, i.e. change power
 - Top candidate for automotive applications**
- ▶ Other advantages relate to the electrolyte being a solid material, compared to a liquid

Disadvantages:

- ▶ Require expensive catalyst material (Platinum)
- ▶ For some applications operating temperature is low
- ▶ The electrolyte is required to be saturated with water to operate optimally.
 - Careful control of the moisture of the anode and cathode streams is important

14 / 41

The Other Types of H₂ Fuel Cells

- ▶ Other fuel cell types are
 - ▶ PAFC – Phosphoric Acid Fuel Cell 175°C
 - ▶ MCFC – Molten Carbonate Fuel Cell 650°C
 - ▶ SOFC – Solid Oxide Fuel Cells 1000°C
- ▶ Hotter cells, slower, more difficult to control
- ▶ Power generation through co-generation

15 / 41

Hydrogen Fuel Storage

- ▶ Hydrogen storage is a challenging task.
- ▶ Some examples of different options.
 - ▶ Compressed Hydrogen storage
 - ▶ Liquid phase – Cryogenic storage, -253°C
 - ▶ Metal hydride
 - ▶ Sodium borohydride $NaBH_4$

16 / 41

Comparison of H₂ Fuel Cells – US DOE

| Fuel Cell Type | Common Electrolyte | Operating Temperature | Typical Stack Size | Efficiency | Applications | Advantages | Disadvantages |
|------------------------------------|--|---|------------------------------|--------------------------------------|--|--|--|
| Polymer Electrolyte Membrane (PEM) | Perfluoro sulfonic acid | 50-100°C 122-212°F typically 80°C | <1kW-100kW | 60% transportation 35% stationary | • Backup power • Portable power • Distributed generation • Transportation • Specialty vehicles | • Solid electrolyte reduces corrosion & electrolyte management problems • Low temperature • Quick start-up | • Expensive catalysts • Sensitive to fuel impurities • Low temperature waste heat |
| Alkaline (AFC) | Aqueous solution of potassium hydroxide soaked in a matrix | 90-100°C 194-212°F | 10-100 kW | 60% | • Military • Space | • Cathode reaction faster in alkaline electrolyte, leads to high performance • Low cost components | • Sensitive to CO ₂ in fuel and air • Electrolyte management |
| Phosphoric Acid (PAFC) | Phosphoric acid soaked in a matrix | 150-200°C 302-392°F | 400 kW 100 kW module | 40% | • Distributed generation | • Higher temperature enables CHP • Increased tolerance to fuel impurities | • Pt catalyst • Long start up time • Low current and power |
| Molten Carbonate (MCFC) | Solution of lithium, sodium, and/or potassium carbonates, soaked in a matrix | 600-700°C 1112-1292°F | 300 kW-3 MW 300 kW module | 45-50% | • Electric utility • Distributed generation | • High efficiency • Fuel flexibility • Can use a variety of catalysts • Suitable for CHP | • High temperature corrosion and breakdown of cell components • Long start up time • Low power density |
| Solid Oxide (SOFC) | Yttria stabilized zirconia | 700-1000°C 1202-1832°F | 1kW-2 MW | 60% | • Auxiliary power • Electric utility • Distributed generation | • High efficiency • Fuel flexibility • Can use a variety of catalysts • Solid electrolyte • Suitable for CHP & CHHP • Hybrid/GT cycle | • High temperature corrosion and breakdown of cell components • High temperature operation requires long start up time and limits |

DMFC – Direct Methanol Fuel Cell

- ▶ Basic operation
 - ▶ Anode Reaction: $CH_3OH + H_2O \Rightarrow CO_2 + 6H^+ + 6e^-$
 - ▶ Cathode Reaction: $3/2O_2 + 6H^+ + 6e^- \Rightarrow 3H_2O$
 - ▶ Overall Cell Reaction: $CH_3OH + 3/2O_2 \Rightarrow CO_2 + 2H_2O$
- ▶ Main advantage, does not need pure Hydrogen.
- ▶ Applications outside automotive
 - battery replacements
 - small light weight
- ▶ Low temperature
- ▶ Methanol toxicity is a problem

Reformers

- ▶ Fuel cells need hydrogen – Generate it on-board
 - Steam reforming of methanol.

Fuel Cell Applications in USA – US DOE

Fuel Cells for Stationary Power, Auxiliary Power, and Specialty Vehicles

The largest markets for fuel cells today are in stationary power, portable power, auxiliary power units, and forklifts.

~75,000 fuel cells have been shipped worldwide.
>15,000 fuel cells shipped in 2009

Fuel cells can be a cost-competitive option for critical-load facilities, backup power, and forklifts.

Fuel Cells for Transportation

In the U.S., there are currently:

- > 200 fuel cell vehicles
- 20 active fuel cell buses
- 60 fueling stations

Sept. 2009: Auto manufacturers from around the world signed a letter of understanding supporting fuel cell vehicles in anticipation of widespread commercialization, beginning in 2015.

Production & Delivery of Hydrogen

In the U.S., there are currently:

- ~9 million metric tons of H₂ produced annually
- > 1200 miles of H₂ pipelines

Source: US DOE 09/2010

Outline

Repetition

Fuel Cell Electric Vehicles

- Fuel Cell Basics
- Fuel Cell Types
- Reformers
- Applications

Fuel Cell Modeling

Practical aspects

- Examples of Components in a Technology Demonstrator

Fuel Cell Thermodynamics

- Starting point reaction equation

- Open system energy – Enthalpy H

$$H = U + pV$$

- Available (reversible) energy – Gibbs free energy G

$$G = H - TS$$

- Open circuit cell voltages

$$U_{rev} = -\frac{\Delta G}{n_e F}, \quad U_{id} = -\frac{\Delta H}{n_e F}, \quad U_{rev} = \eta_{id} U_{id}$$

F – Faradays constant ($F = q N_0$)

- Heat losses under load $P_l = I_{fc}(t) (U_{id} - U_{fc}(t)) \Rightarrow$ **Cooling system**

Quasistatic Modeling of a Fuel Cell

- Causality diagram

- Power amplifier (Current controller)
- Fuel amplifier (Fuel controller)
- Standard modeling approach
- Keys for understanding:
 - Cell – The **polarization curve**
 - Operation – The Surrounding **System**

Fuel Cell Performance – Polarization curve

- Polarization curve of a fuel cell

Relating current density $i_{fc}(t) = I_{fc}(t)/A_{fc}$, and cell voltage $U_{fc}(t)$ Curve for one operating condition

- Fundamentally different compared to combustion engine/electrical motor

- Excellent part load behavior

–When considering only the cell
– η_{cell} follows the Voltage

Single Cell Modeling

Fuel cell voltage

$$U_{fc}(t) = U_{rev}(t) - U_{act}(t) - U_{ohm}(t) - U_{conc}(t)$$

- ▶ Activation energy – Get the reactions going
Semi-empirical Tafel equation

$$U_{act}(t) = c_0 + c_1 \ln(i_{fc}(t)), \text{ or } U_{act}(t) = \dots$$

- ▶ Ohmic – Resistance to flow of ions in the cell

$$U_{ohm}(t) = i_{fc}(t) \tilde{R}_{fc}$$

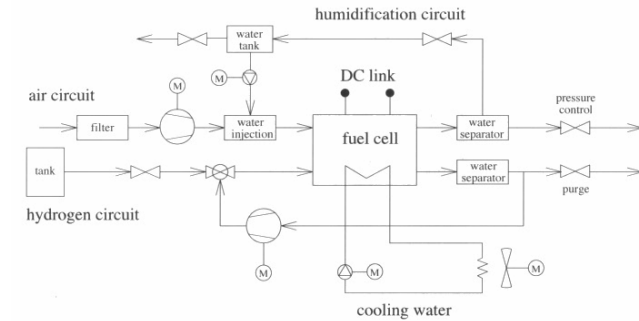

- ▶ Concentration, change in concentration of the reactants at the electrodes

$$U_{conc}(t) = c_2 \cdot i_{fc}(t)^{c_3}, \text{ or } U_{conc}(t) = \dots$$

25 / 41

Fuel Cell System Modeling

- ▶ A complete fuel cell system

- ▶ Power at the stack with N cells

$$P_{st}(t) = I_{fc}(t) U_{fc}(t) N$$

26 / 41

Important effects for the cell and system

Cell Pressure

Cell excess air λ

Boosting the performance

27 / 41

Fuel Cell System Modeling

- ▶ Describe all subsystems with models

$$P_2(t) = P_{st}(t) - P_{aux}(t)$$

$$P_{aux} = P_0 + P_{em}(t) + P_{ahp}(t) + p_{hp}(t) + P_{cl}(t) + p_{cf}(t)$$

em – electric motor, ahp – humidifier pump, hp – hydrogen recirculation pump, cl – coolant pump, cf – cooling fan.

- ▶ Submodels for:
Hydrogen circuit, air circuit, water circuit, and coolant circuit

28 / 41

Fuel Cell System Performance at Low and High P_c

Individual Cell

Fuel Cell System

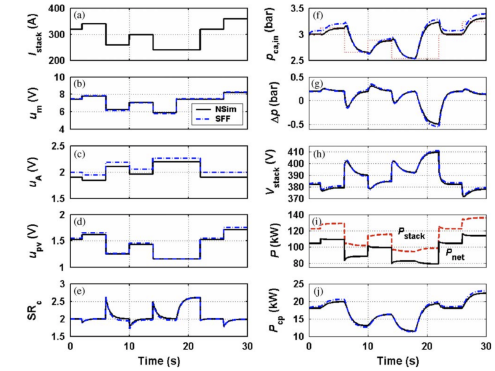

- Efficiency is highest at part loads towards low load.
- The system is stealing current to keep the cell operating.

Fuel Cell System Dynamics

Open Loop Steps on Inputs

Note

- ▶ λ , bottom left
- ▶ Pressure, top right
- ▶ Gap in Cell & Output Power
- ▶ Due to compressor power

The system has non-negligible dynamics.
