

Vehicle Propulsion Systems

Lecture 9

Case Study 6 Fuel Cell Vehicle and Optimal Control

Lars Eriksson
Professor

Vehicular Systems
Linköping University

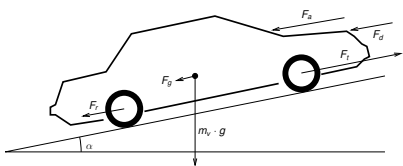

May 15, 2017

1/43

The Vehicle Motion Equation

Newtons second law for a vehicle

$$m_v \frac{d}{dt} v(t) = F_t(t) - (F_a(t) + F_r(t) + F_g(t) + F_d(t))$$

- ▶ F_t – tractive force
- ▶ F_a – aerodynamic drag force
- ▶ F_r – rolling resistance force
- ▶ F_g – gravitational force
- ▶ F_d – disturbance force

3/43

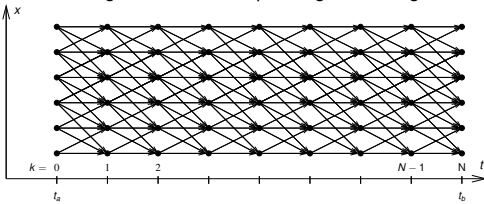

Deterministic Dynamic Programming – Basic algorithm

$$J(x_0) = g_N(x_N) + \sum_{k=0}^{N-1} g_k(x_k, u_k)$$

$$x_{k+1} = f_k(x_k, u_k)$$

Algorithm idea:

Start at the end and proceed backward in time to evaluate the optimal cost-to-go and the corresponding control signal

5/43

On-Line Control – ECMS

- ▶ Given the optimal λ^* (cycle dependent exchange rate between fuel and electricity).
- ▶ Hamiltonian

$$H(t, q(t), u(t), \lambda^*) = P_f(t, u(t)) + \lambda^* P_{ech}(t, u(t))$$

- ▶ Optimal control action

$$u^*(t) = \arg \min_u H(t, q(t), u, \lambda^*)$$

- ▶ Guess λ^* , run one cycle see end SOC, update λ^* , and iterate until $SOC(t_f) \approx SOC(0)$.

7/43

Outline

Case study 6: Fuel Optimal Trajectories of a Racing FCEV
Model compilation

Model simplification

Formulating the optimal control problem

Optimal Controllers Solutions

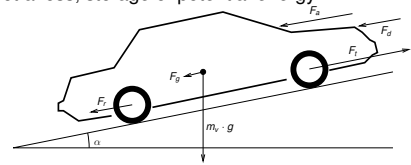

Final Results

Some Additional Material – Fuel Consumption

2/43

Gravitational Force

- ▶ Gravitational load force
–Not a loss, storage of potential energy

- ▶ Up- and down-hill driving produces forces.

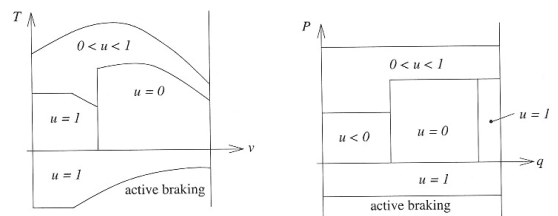

$$F_g = m_v g \sin(\alpha)$$

- ▶ Flat road assumed $\alpha = 0$ if nothing else is stated (In the book).

4/43

On-Line Control – Heuristic Control Approaches

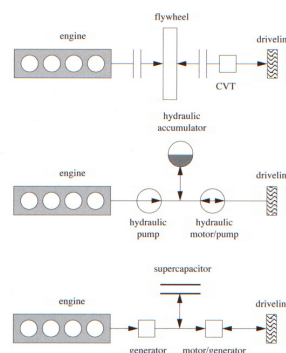

- ▶ Parallel hybrid vehicle (electric assist)

- ▶ Determine control output as function of some selected state variables:
vehicle speed, engine speed, state of charge, power demand, motor speed, temperature, vehicle acceleration, torque demand

6/43

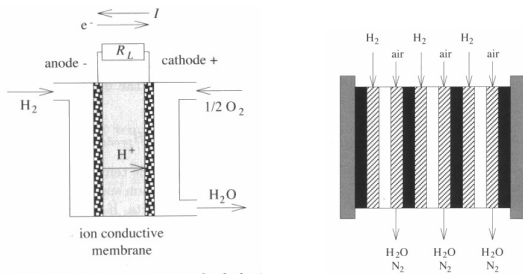

Examples of Short Term Storage Systems

8/43

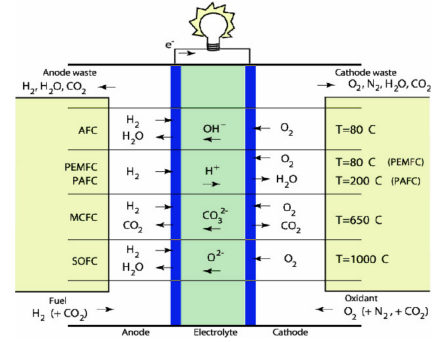

Fuel Cell Basic Principles

- ▶ Convert fuel directly to electrical energy
- ▶ Let an ion pass from an anode to a cathode
- ▶ Take out electrical work from the electrons
- ▶ Fuel cells are stacked ($U_{cell} \leq 1V$)

9/43

Overview of Different Fuel Cell Technologies

10/43

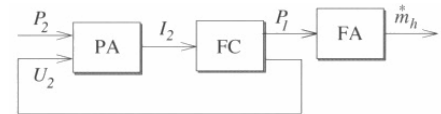

Hydrogen Fuel Storage

- ▶ Hydrogen storage is problematic – Challenging task.
- ▶ Some examples of different options.
 - ▶ High pressure bottles
 - ▶ Liquid phase – Cryogenic storage, -253°C.
 - ▶ Metal hydride
 - ▶ Sodium borohydride $NaBH_4$

11/43

Quasistatic Modeling of a Fuel Cell

- ▶ Causality diagram

- ▶ Power amplifier (Current controller)
- ▶ Fuel amplifier (Fuel controller)
- ▶ Standard modeling approach

12/43

Fuel Cell Thermodynamics

- ▶ Starting point reaction equation

- ▶ Open system energy – Enthalpy H

$$H = U + pV$$

- ▶ Reversible energy – Gibbs free energy G

$$G = H + TS$$

- ▶ Open circuit cell voltages

$$U_{rev} = -\frac{\Delta G}{n_e F}, \quad U_{id} = -\frac{\Delta H}{n_e F}, \quad U_{rev} = \eta_{id} U_{id}$$

F – Faradays constant ($F = q N_0$)

- ▶ Under load

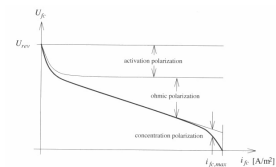

$$P_l = I_{fc}(t)(U_{id} - U_{fc}(t))$$

13/43

Fuel Cell Performance – Polarization curve

- ▶ Polarization curve of a fuel cell

Relating current density $i_{fc}(t) = I_{fc}(t)/A_{fc}$, and cell voltage $U_{fc}(t)$

Curve for one operating condition

- ▶ Fundamentally different compared to combustion engine/electrical motor
- ▶ Excellent part load behavior
- When considering only the cell

14/43

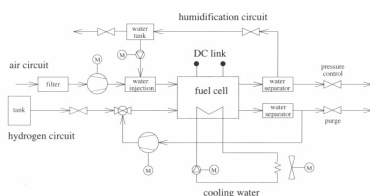

Fuel Cell System Modeling

- ▶ Describe all subsystems with models

$$P_2(t) = P_{st}(t) - P_{aux}(t)$$

$$P_{aux} = P_0 + P_{em}(t) + P_{ahp}(t) + P_{hp}(t) + P_{cl}(t) + P_{cf}(t)$$

em–electric motor, ahp – humidifier pump, hp – hydrogen recirculation pump, cl – coolant pump, cf – cooling fan.

- ▶ Submodels for: Hydrogen circuit, air circuit, water circuit, and coolant circuit

Model compilation

Model simplification

Formulating the optimal control problem

Optimal Controllers Solutions

Final Results

Some Additional Material – Fuel Consumption

16/43

Problem Setup

- ▶ Run a fuel cell vehicle optimally on a racetrack

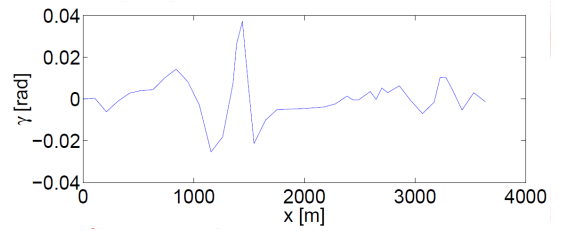

- ▶ Start up lap
- ▶ Repeated runs on the track
- ▶ Path to the solution
 - ▶ Measurements – Model
 - ▶ Simplified model
 - ▶ Optimal control solutions

17/43

Problem Setup – Road Slope Given

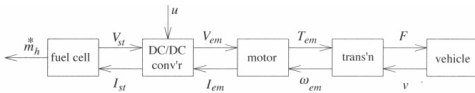

Road slope $\gamma = \alpha(x)$

18/43

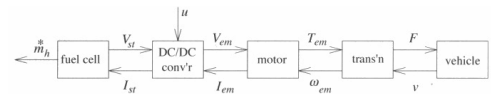

Model Causality

Model causality – Dynamic model

19/43

Model Component – Fuel Cell

- ▶ Current in the cell and losses

$$I_{fc}(t) = I_{fc}(t) + I_{aux}(t)$$

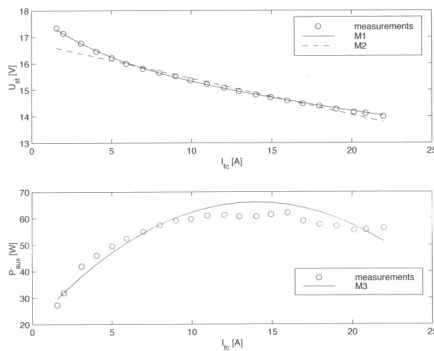

- ▶ Current and hydrogen flow

$$\dot{m}_H(t) = c_9 I_{fc}(t)$$

- ▶ Next step: Polarization curve and auxiliary consumption

20/43

Fuel Cell – Polarization and Auxiliary Components

21/43

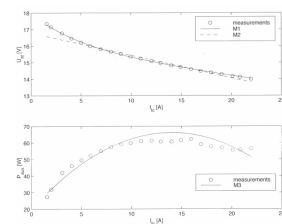

Fuel Cell – Polarization and Auxiliary Components

- ▶ Polarization curve

$$U_{st}(t) = c_0 + c_1 \cdot e^{-c_2 \cdot I_{fc}(t)} - c_3 \cdot I_{fc}(t)$$

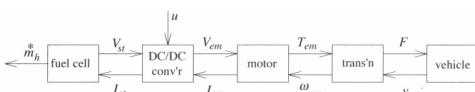

- ▶ Auxiliary power

$$P_{aux}(t) = c_6 + c_7 \cdot I_{fc}(t) + c_8 \cdot I_{fc}(t)^2$$

22/43

Model Component – DC Motor Controller

- ▶ DC motor voltage (from control signal u)

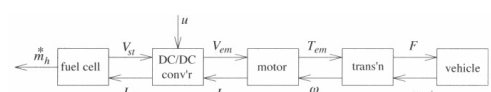

$$U_{em}(t) = \kappa \omega_{em}(t) + K R_{em} u(t)$$

- ▶ Current requirement at the stack

$$I_{st} = \frac{U_{em}(t) I_{em}(t)}{\eta_c U_{st}(t)}$$

23/43

Model Component – DC Motor

- ▶ DC motor current

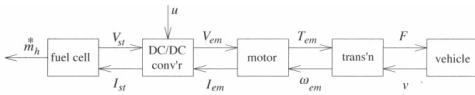

$$I_{em}(t) = \frac{U_{em}(t) - \kappa \omega_{em}(t)}{R_{em}}$$

- ▶ DC motor torque

$$T_{em}(t) = \kappa_{em} I_{em}(t)$$

24/43

Model Component – Transmission and Wheels

- ▶ Tractive force

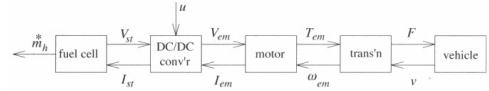

$$F(t) = \eta_t^{\pm 1} \frac{\gamma T_{em}(t)}{r_w}$$

- ▶ Rotational speed

$$\omega_{em}(t) = \frac{\gamma v(t)}{r_w}$$

25/43

Model Compilation 1 – Vehicle

- ▶ The vehicle tractive force can now be expressed as

$$F(t) = \frac{\eta_t \gamma}{r_w} \kappa_{em} K u(t)$$

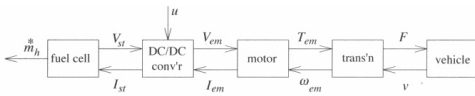

- ▶ Dynamic vehicle velocity and position model

$$\frac{d}{dt} v(t) = h_1 u(t) - h_2 v^2(t) - g_0 - g_1 \alpha(x(t))$$

$$\frac{d}{dt} x(t) = v(t)$$

26/43

Model Compilation 2 – Fuel Consumption

- ▶ Fuel flow, $\dot{m}_H(t) = c_3 I_{fc}(t)$

$$I_{fc}(t) = \frac{P_{aux}(I_{st}(t))}{U_{st}(I_{st}(t))} + \frac{K u(t)}{\eta_c U_{st}(I_{st}(t))} \left(K R_{em} u(t) + \kappa_{em} \frac{\gamma}{r_w} v(t) \right)$$

–Implicit nonlinear static function

- ▶ Simpler model

$$\dot{m}_H(t) = b_0 + b_1 v(t) u(t) + b_2 u^2(t)$$

27/43

Final Results

Some Additional Material – Fuel Consumption

28/43

Simplified Fuel Consumption – Validation

29/43

Detour

- ▶ Occam's razor:
 - The explanation of any phenomenon should make as few assumptions as possible.
 - Shave of those who are unnecessary.
- ▶ Law of Parsimony: Among others a factor in statistics: In general, mathematical models with the smallest number of parameters are preferred as each parameter introduced into the model adds some uncertainty to it.
- ▶ Another viewpoint.
 - Try to simplify the problem you solve as much as possible.
 - Neglect effects and be proud when you are successful!

Optimal Controllers Solutions

Final Results

Some Additional Material – Fuel Consumption

Optimal Control Problems

- ▶ Start of the cycle

$$v(0) = 0, \quad x(0) = 0$$

$$\lambda_1(t_f) = 0, \quad x(t_f) = x_f = v_m t_f$$

- ▶ Periodic route

$$x(0) = 0$$

$$\lambda_1(t_f) = \lambda_1(0), \quad x(t_f) = x_f = v_m t_f, \quad v(t_f) = v(0)$$

31/43

32/43

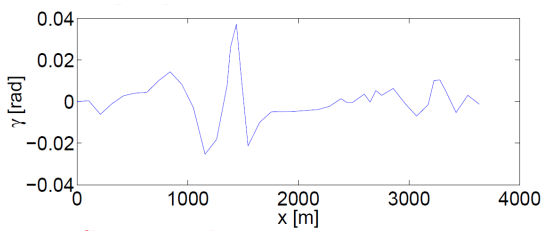

Simple controller for the start

$$u(t) = K_p (f v_m - v(t)) + K_i \int_0^t (f v_m - v_i(t)) dt$$

f -tuning parameter ≈ 1 to allow for matching the average speed

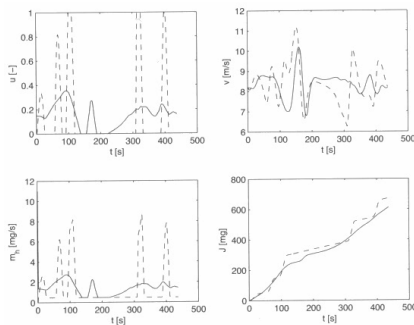

Problem Setup – Road Slope Given

Road slope $\gamma = \alpha(x)$

Fuel Optimal Trajectory – Continuous Driving

Fuel optimal trajectory has 9% lower fuel consumption

Final Results in Shell Eco Marathon
